Blumira

Blumira Agent: Endpoint Security

REMOTE ENDPOINT MONITORING

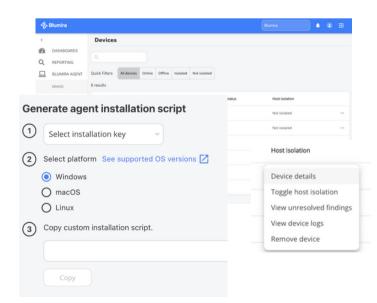

Save time monitoring remote endpoints and gain broader visibility across your entire environment. Easily install a lightweight Blumira Agent on your Windows, Mac & Linux remote endpoints to send logs to Blumira's SIEM platform for advanced threat analysis, detection and response.

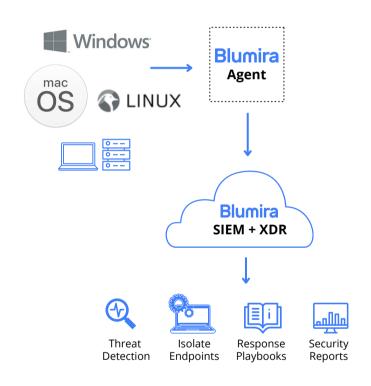

By correlating your endpoint data against many other data sources, Blumira detects and helps you respond to early signs of attackers to prevent ransomware and a data breach.

BLUMIRA AGENT BENEFITS

- Security coverage for work-from-home employees & all remote endpoints across Windows, Mac & Linux
- Gain broader visibility into remote endpoint risks; detect and quickly remediate threats
- Frictionless agent installation takes minutes; requires no sensor or on-premises infrastructure
- Contain threats immediately to prevent ransomware
- Easily satisfy compliance & cyber insurance requirements for data retention, SIEM & endpoint security

WHAT YOU CAN DO

- Save time managing & monitoring your devices with one platform
- Detect threats that other tools may miss by comparing data across entire environment, not just endpoint
- Respond automatically by isolating devices during off hours, keeping your business safe 24/7
- Easily manage all devices & see their agent status (off/online/isolated) in one platform
- Streamline security workflows by accessing associated logs & findings within Report Builder

Blumira

Blumira Agent: Managed Detections

DETECT & RESPOND TO:

- Anomalous access attempts
- Exploitation of known vulnerabilities
- Malicious processes running on Windows
- Elevation of privileges to domain admin
- Brute-force (unauthorized access) attacks
- Attempted lateral attacker movement
- Tools used by ransomware threat actors
- Signs of attacker evasion
- Suspicious changes to files
- And many more -- Blumira adds new detections every two weeks for the most up-to-date coverage

SEE DEVICE DETAILS

Detection rules are managed entirely by Blumira's detection engineers

Indicator: COMSPEC in Registry Persist/Lateral Movement			
Lateral Move	ment		
Threat	Priority 1

ANALYSIS COMSPEC is an en	vironmental variable in Micro	soft windows that will be interprete	ed as cmd.exe.
The use of this vari	able in the registry is a taction	that threat actors often employ for	r persistence

The use of this variable in the registry is a tactic that threat actors often employ for persistence and can be used in several ways to facilitate lateral movement via remote service execution that then calls to a PowerShell script in the registry. This is a high fidelity alert, and has a high chance of being an indication of lateral movement.

Save on resources required to monitor your endpoints with Blumira Agent, designed for minimal impact to your network for greater security coverage.

Blumira Agent works well with other agents and processes running on your systems, providing an additional layer of security.

It provides advanced Windows, Mac & Linux logging for remote endpoints directly to Blumira's cloud -- no sensor required. **This saves you time** required to manage a sensor, as Blumira's team automatically updates Blumira Agent.

Available on SIEM+ and XDR Platform editions.

I deployed to endpoints with the RMM tool and used Blumira's script. **It was easier than I thought and I** was happy with that.

Blumira Agent is on a handful of machines right now. It alerts me when it detects potential threats and is great for endpoints that aren't directly attached to the corporate network.
